compositions comprising: (a) a BPI, or a nucleic acid encoding a BPI, and a carrier; or (b) the antibody of (1), or a fragment or derivative of the antibody, and a carrier; or (1) screening for agents that interact with one or more BPIs, BPI fragments, polypeptides related to BPIs, or BPI-fusion or more BPIs, BPI fragments, polypeptides related to BPIs, or BPI-fusion or proteins; (4) screening for or identifying agents that modulate the expression or activity of one or more BPIs, a BPI fragment, a BPI-related to Polypeptide, or BPI-fusion proteins; and (5) treating or preventing compression or activity of one or more BPIs, a BPI fragment, a BPI-related to Polypeptide, or BPI-fusion proteins; and (5) treating or preventing complements. The range or severity of one or accreening, diagnosing or determining the strength or severity of breast cancer, identifying a subject at risk of developing breast cancer, or monitoring the effect of therapy or developing breast cancer, or monitoring the effect of therapy or administered to a subject with breast cancer. The antibodies the activity of one or more BPIs are useful for treating or preventing breast cancer. ABBF3104 to ABBF320 represent breast cancer associated tryptic digest peptides, which are useful for treating or preventing breast cancer.

```

The present invention relates to oxidised apolipoprotein A-I (ApoA-I) where at least Met residue 86 is oxidised to Met(O). This can be used in the prevention, diagnosis and treatment of lipid associated disorders,

```
ö
including coronary vascular disease, ischaemic heart disease, atherosclerosis and dyslipidaemias. The present sequence is a fragment of the ApoA-I protein isolated in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is mouse alpha helical protein-34 (Zalpha34) artigenic epitope. Zalpha34 polymucleotides, polypeptides and antibodies are useful as educational tools, as a laboratory practicum kits for courses related to genetics and molecular biology, protein chemistry and antibody production and analysis. Zalpha34 is useful for promoting entibodies that specifically binds to Zalpha34 groups, peptides or polypeptides. The antibodies are useful for inhibiting spermatogenesis and to isolate DNA sequences that encode human Zalpha34 genes from cDNA libraries. Zalpha34 polypeptides are useful as an aid to teach preparation of antibodies, identifying proteins by western blotting, protein purification and determining the weight of expressed Zalpha34
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polypeptides as a ratio to total protein expressed. Fusion proteins comprising Zalpha34 and a Fc group are useful as an in vitro assay tool and antibody-Zalpha34 fusion comprising antibody variable domains are useful as therapeutic proteins, in which the antibody group binds with the target antigen, such as a tumour associated antigen
                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Educational kit useful for courses related to genetics, molecular biology, protein chemistry, antibody production and analysis, has a container having novel alpha helical protein-34 polypeptide or
                                                                                                                                                                                                                                                                                                                                                                                                   Mouse alpha helical protein-34 (Zalpha34) antigenic epitope #12

The present invention describes an agonist (A) of apolipoprotein A-I (apoA-I) which is a 14-22 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SXXXE
                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an educational kit or aid for teaching protein chemistry comprising a container having the isolated, novel hormonal/

C cytokine alpha helical protein 34 (secreted protein alpha, 2alpha34)

polypeptide, comprising defined amino acid sequences (AAU99639-AAU99654)

given in the specification and/or the isolated polypeptides comprising

(AAU99639-AAU99654). The educational kit or teaching aid may be used to teach protein chemistry. A novel full-length Zalpha34 protein can be used so the student can have practical learning experiences in protein procedures, protein re-folding when the protein is produced in proxaryctic host cells, and how to make both monoclonal and polyclonal antibodies. Antibodies that bind to mature Zalpha34 proteins can also be used to learn how to make both monoclonal and polyclonal antibodies. Antibodies affinity purification columns, to do enzymetinked immunoabsorbent assays (ELISA). The mouse gene encoding Zalpha34 is located on chromosome 7. Zalpha34 is useful for promoting spermatogenesis. The present sequence is an immunogenic epitope from the mouse Zalpha34 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (apoA-1) which is a 15-29 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atheroscierosis, restenosis, HDL (high density lipoprotein) or apoA-1 deficiency; hypertriglyceridemia and metabolic syndrom, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also too image HDL at e.g. atherosclerotic streaks, and to raise antibodies. AAY18934 to AAY19187 represent legithin; cholesterol acyltransferase (LCAT) activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Apolipoprotein A-I; agonist; dyslipidemic disorder; dyslipidemia; human; lecituln:cholesteerol acyltransferase; LCAT; hypercholesterolaemia; cardicovascular disease; atherosecleroseis; restenosis; HDL; apoA-I; high density lipoprotein; hypertriglyceridemia; metabolic syndrome;

Gene therapy, apolipoprotein A-I; agonist; dyslipidemic disorder; ApoA-I; cardiovascular disease; atherosclerosis; restenosis; LCAT; hyperlipidemia; septic shock; lecithin:cholesterol acyltransferase.
                                                                                                                                                                                              The present invention describes an agonist (A) of apolipoprotein A-I (apoA-I) which is a 15-29 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertriglyceridemia am metabolic syndrome, also for treating septic shock. When labeled (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to Image HDL at e.g. atherosclerotic streaks, and to raise antibodies. AAY19188 to AAY1941 represent lecithin-cholesterol acyltransferase (LCAT) activity exhibiting core peptides, which are apoA-I agonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lecithin: cholesterol acyltransferase activation exhibiting peptide #73.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Novel apolipoprotein agonist treating subject suffering from disorder associated with dyslipidemia such as hypercholesterolemia, cardiovascular disease, atherosclerosis, restenosis, hypertriglyceridemia or metabolic syndrome.
                                                                                                                                                                                                                                                                                                                 The invention describes an apolipoprotein A-I (ApoA-I) agonist (A) comportsing a 15-29 residue peptide or peptide analogue which forms an amphipathic alpha-helix in the presence of lipids or its salt. (A) is useful for treating a subject suffering from a disorder associated with dyslipidaemia (hypercholesterolaemia, cardiovascular disease, atherosclaerosis, restenosis, high density lipoprotein (HDL) or Apia-I deficiency, hypertriglyceridaemia or metabolic syndrome) or septic shock this is the amino acid sequence of a ApoA-I agonist peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          dyslipidaemia; hypercholesterolaemia; cardiovascular disease; atherosclerosis; restenosis; high density lipoprotein deficiency; HDL deficiency; hypertriglyceridaemia; metabolic syndrome; septic shock; coronary heart disease; endotoxaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Apo lipoprotein A-I agonist; ApoA-I agonist; amphipathic alpha-helix;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                27.9%; Score 56; DB 8; Length 22; 42.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                         applipoprotein A-I (apoA-I) agonist (B) that is a peptide, or analog, which forms an amphipathic alpha-helix in presence of lipids. (A), optionally as a complex with lipids, and host cells that contain (A), are useful for gene therapy, or prevention, of diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) and apoA-I efficiency, hypertriglyceridemia and metabolic syndrome, also to treat endotoxemia (septic shock). Host cells containing (A) can also be used to study the role of apoA-I in lipid metabolism. (B) can be used diagnostically, e.g. to measure serum HDL (particularly its subpopulation involved in retrograde cholesterol transport) and for imaging the circulatory system or HDL accumulations at fatty streaks. The present

The invention relates to an antioxidant peptide. The methods and compositions of the present invention are useful for diagnosing and treating cardiovascular disease, ischaemia, bone disease and other inflammatory related diseases. The present sequence represents the amino acid sequence of a peptide with antioxidant activity.
          of a protein with c-foss protein; and (4) detecting (MII) the interaction of a protein with c-foss protein; and (4) detecting (MII) the interaction protein as mentioned in (3) with c-fos protein, by contacting the protein with c-fos, to form a complex. (MI) is useful for detecting its interaction with c-fos, to form a complex. (MI) is useful for screening the protein that interacts with c-fos which involves performing the cheetcrion process and selecting the protein that interacts with c-fos. (MI) is useful for screening inhibitors that interact with c-fos which involves performing (MI) and selecting the detected protein. (I) is useful for screening inhibitors that interact with c-fos which can interact with c-fos which can interact with c-fos in the exemplification of the present invention.
with c-fos protein; (3) an inhibitor (IV) that inhibits interaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New cysteine-containing peptides, having antioxidant properties, useful for diagnosing and treating cardiovascular disease, ischemia, bone disease and other inflammatory related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cardiovascular disease; ischaemia; bone disease; related disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 18;

                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                           The invention comprises Apo lipoprotein A-I (ApoA-I) agonist peptides which form an amphipathic alpha-helix in the presence of lipids. The ApoA-I peptides of the invention are useful for treating a disorder associated with dyslipidaemia, such as: hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, high density lipoprotein (HDL) deficiency, ApoA-I deficiency, hypertriglyceridaemia, metabolic syndrome, and septic shock. The ApoA-I peptides are also useful for treating coronary heart disease and endotoxaemia. The present amino acid sequence represents an ApoA-I agonist peptide of the invention.
                                                             New Apo lipoprotein A-I agonist useful for treating disorders associated with dyslipoproteinemia e.g. hypercholesterolemia orseptic shock, comprises 15-29 reside peptide or analog which forms amphipathic alpha-

The invention relates to an antioxidant peptide. The methods and compositions of the present invention are useful for diagnosing and treating cardiovascular disease, ischaemia, bone disease and other inflammatory related diseases. The present sequence represents the amino acid sequence of a peptide with antioxidant activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New cysteine-containing peptides, having antioxidant properties, useful for diagnosing and treating cardiovascular disease, ischemia, bone disease and other inflammatory related diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an antioxidant peptide. The methods and compositions of the present invention are useful for diagnosing and treating cardiovascular disease, ischaemia, bone disease and other inflammatory related diseases. The present sequence represents the amino acid sequence of a peptide with antioxidant activity.
                                                                                                                                                                                                                                                                                                                                                                                                                               New cysteine-containing peptides, having antioxidant properties, useful for diagnosing and treating cardiovascular disease, ischemia, bone disease and other inflammatory related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

```

```
The invention relates to an antioxidant peptide. The methods and compositions of the present invention are useful for diagnosing and treating cardiovascular disease, ischaemia, bone disease and other inflammatory related diseases. The present sequence represents the amino acid sequence of a peptide with antioxidant activity.

Sequence 15, Application US/09695458

Patent No. 6380361

GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Taft, David W.
TITLE OF INVENTION: Educational Kit and Method Containing No. 6380361el Alpha Helical
TITLE OF INVENTION: Protein-34
FILE REFERENCE: 99-78
CURRENT APPLICATION NUMBER: US/09/695,458
CURRENT APPLICATION NUMBER: 60/162,623
PRIOR APPLICATION NUMBER: 60/162,623
PRIOR FILING DATE: 1999-10-29
NUMBER OF SEQ ID NOS: 41
SOFTWARE: FastSEQ for Windows Version 3.0
SEQ ID NO 15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ä

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The mutant ApoA-I polymucleotide is useful for preparing a composition for treating cardiovascular disorder. Sequences ABR44037-44 represent ApoA-I fragments from various species where the leucine at position 178 is highly conserved except in pig (ABR44042)

The invention relates to a mutation of the apolipoprotein A-I (ApoA-I) comprising a leucine to proline variant in position 178. The mutant ApoA-I polymuclochide is useful for preparing a composition for treating cardiovascular disorder. Sequences ABR44037-44 represent ApoA-I fragments from various species where the leucine at position 178 is highly conserved except in pig (ABR44042)
                                                                                                                                                                                                                                              useful for preparing a composition for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a mutation of the apolipoprotein A-I (ApoA-I) comprising a leucine to proline variant in position 178. The mutant ApoA-I polynucleotide is useful for preparing a composition for treating cardiovascular disorder. Sequences ABR44037-44 represent ApoA-I fragments from various species where the leucine at position 178 is highly conserved except in pig (ABR44042)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New Apoliprotein A-1 mutation, useful for preparing a composition for

The invention relates to a mutation of the apolipoprotein A-I (ApoA-I) comprising a leucine to proline variant in position 178. The mutant ApoA-I polymuclocide is useful for preparing a composition for treating cardiovascular disorder. Sequences ABR44037-44 represent ApoA-I fragments from various species where the leucine at position 178 is highly conserved except in pig (ABR44042)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a mutation of the apolipoprotein A-I (ApoA-I) comprising a leucine to proline variant in position 178. The invention relates to an antioxidant peptide. The methods and compositions of the present invention are useful for diagnosing and treating cardiovascular disease, ischaemia, bone disease and other inflammatory related diseases. The present sequence represents the amino acid sequence of a peptide with antioxidant activity.
                                                                                                                                                                             Gaps

                                                                                                                                                The invention relates to a mutation of the apolipoprotein A-I (ApoA-I) comprising a leucine to proline variant in position 178. The mutant ApoA-I polymuclostide is useful for preparing a composition for treating cardiovascular disorder. Sequences ABR44037-44 represent ApoA-I fragments from various species where the leucine at position 178 is highly conserved except in pig (ABR44042)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an antioxidant peptide. The methods and compositions of the present invention are useful for diagnosing and treating cardiovascular disease, ischaemia, bone disease and other inflammatory related diseases. The present sequence represents the amino acid sequence of a peptide with antioxidant activity.
                                                                                       New Apoliprotein A-1 mutation, useful for preparing a composition for treating cardiovascular disorder.
                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New cysteine-containing peptides, having antioxidant properties, us for diagnosing and treating cardiovascular disease, ischemia, bone disease and other inflammatory related diseases.
                                                                                                                                                                                                                                                                                ı,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a mutation of the apolipoprotein A-I (ApoA-I) comprising a leucine to proline variant in position 178. The mutant ApoA-I polynuciocitéd is useful for preparing a composition for treating cardiovascular disorder. Sequences ABR44037-44 represent ApoA-I fragments from various species where the leucine at position 178 is highly conserved except in pig (ABR44042)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            useful for preparing a composition for

The invention relates to a browsable database system for use with biological information, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recogniser and an output. The invention also provides a method of operation for use with a browsable biological database system. The browsable database system and methods are useful in analysing protein sequences, classifying gene products, predicting biological role for pathway building, enhancing interpretation of expression information, providing protein function and in facilitating comparative genomic analysis. The present sequence is human apolipoprotein A (APO-A) IV precursor protein. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     <u>,</u>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a mutation of the apolipoprotein A-I (ApoA-I) comprising a leucine to proline variant in position 178. The mutant ApoA-I polynucleotide is useful for preparing a composition for treating carditovascular disorder. Sequences ABRA4037-44 represent ApoA-I fragments from various species where the leucine at position 178 is highly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Browsable database system; ontology; protein analysis;

                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                 ð
                                                                         the encoded proteins (AAO000010-AAO13910) that exhibit activity elating cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymorlectides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. steem cell growth factor activity, hamalopolesis regulating activity, issue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a browsable database system for use with biological information, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recogniser and an output. The invention also provides a method of operation for use with a browsable biological database system. The browsable database system and methods are useful in analysing protein sequences, classifying gene products, predicting biological role for pathway building, enhancing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Browsable database system; ontology; protein analysis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           biological information, comprises a datactore, an ontology of categories of biological functions, an input receptive, a recogniser and an output. The invention also provides a method of operation for use with a browsable biological database system. The browsable database system and methods are useful in analysing protein sequences, classifying gene products, predicting biological role for pathway building, enhancing interpretation of expression information, providing protein function and in facilitating comparative genomic analysis. The present sequence is pig apolipoprotein A (APO-A) IV precursor protein. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Browsable database system, for e.g. analyzing protein sequences, and predicting a biological role, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recognizer, and
interpretation of expression information, providing protein function and in facilitating comparative genomic analysis. The present sequence is monkey apolipoprotein A (APO-A) IV precursor protein. This sequence is used to illustrate the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Browsable database system, for e.g. analyzing protein sequences, and predicting a biological role, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recognizer, and an output.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a browsable database system for use with biological information, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recogniser and an output. The invention also provides a method of operation for use with a browsable biological database system. The browsable database system and methods are useful in analysing protein sequences, classifying gene products, predicting biological role for pathway building, enhancing interpretation of expression information, providing protein function and in facilitating comparative genomic analysis. The present sequence is baboon apolipoprotein A (APO-A) IV precursor protein. This sequence is used to illustrate the method of the invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence

Sequence 15, Application US/10142238A

Publication No. US20030087819A1

GENERAL INFORMATION:

APPLICATION TOWNERTION:

TILLE OF INVENTION: CYSTEINE-CONTAINING PEPTIDES HAVING OXIDANT PROPERTIES

FILE REFERENCE: 1B-1705

CURRENT APPLICATION NUMBER: US/10/142,238A

CURRENT APPLICATION NUMBER: US/60/289,944

PRIOR PILING DATE: 2001-05-09

NUMBER OF SEQ ID NOS: 84

SOFTWARE: PATENTIAL SEQUENCE

LENGTH: 18

TYPE: PRT

NAME/KEY: PEPTIDE

LOCATION: (1) . (18)

OTHER INFORMATION: HUMAN GENETIC ORIGIN

Sequence 57, Application US/08182175A

Patent No. 555923

GENERAL INFORMATION:

APPLICANT: Saverio Carl Falco
APPLICANT: Sharon J. Keeler
APPLICANT: Janet A. Rice
TITLE OF INVENTION: Synthetic Storage Proteins with Defined Structure Containing
NUMBER OF SEQUENCES: 113

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                      2 KLHELQEKLSPLGEEMRDRARAHVDALRTHLAPYSDELRQRLAARLEALKENGGARLAEY 61
